

Further examples of input for testing extensions to your functional calculator

(suggested by the examination questions)

The other set of EGxx.FUN are still available if you want to reuse them.

You can (and probably should) devise some test cases of your own. Keep them simple.

Some of the ones below have deliberate errors, some will not run properly even if they compile properly.

After successfully using

```
CMAKE CalcPVM
```

you can test any little program called

```
Something.FUN
```

by issuing the command

```
Test Something
```

(no parameter required)

```
// =====
$C+ // generate .cod file for checking manually
// What could be more meaningless than this, but try it anyway!  EXAM00.FUN

    // function definition
    AssertInRange(x, l, h) returns (x >= l) && (x <= h);

    // trial calls
    t = 400 > 300;
    read("Supply two numbers ", x, y);
    writeLine("Is x > y?", x > y);
    writeLine(AssertInRange(x, x, x));
    writeLine(AssertInRange(x, false, true) == true);

// =====
$C+ // generate .cod file for checking manually
// Very silly - what do you suppose happens and why?  EXAM01.FUN

    // function definition
    Silly(x) returns 2 * Silly(x);

    // trial call
    write ( silly(x) );

// =====
$C+ // generate .cod file for checking manually
// An example with errors  EXAM02.FUN

    // function definitions
    sum(x, y, z) returns x + y;
    Product(x, y, z) returns x * y * z;

    // trial call
    read("Supply three numbers ", x, y, z);
    writeLine("Their sum is ", Sun(x, y, z));
    writeLine("Their product is ", Product());
```

```

// =====
$C+ // generate .cod file for checking manually
// Example of recursive function - Factorial EXAM03.FUN

    // function definition

    Factorial(n) returns
        if (n <= 0) returns 1;
        else returns n * Factorial(n - 1);

    // trial calls

    writeLine(" 0! =", Factorial(0));
    writeLine(" 1! =", Factorial(1));

    read ("Supply number ", n);
    writeLine(n, "! =", Factorial(n));

// =====
$C+ // generate .cod file for checking manually
// Example of recursive function - Factorial EXAM03.FUN

    // function definition

    Factorial(n) returns
        if (n <= 0) returns 1;
        else returns n * Factorial(n - 1);

    // trial calls

    writeLine(" 0! =", Factorial(0));
    writeLine(" 1! =", Factorial(1));

    read ("Supply number ", n);
    writeLine(n, "! =", Factorial(n));

// =====
$C+ // generate .cod file for checking manually
// Example of recursive function - Fibonacci EXAM05.FUN

    // function definition

    Fib(x) returns
        if (x == 0) returns 0;
        else if (x == 1) returns 1;
        else returns Fib(x - 1) + Fib(x - 2);

    // trial calls

    writeLine("fib(", 0, ") =", Fib(0));
    writeLine("fib(", 1, ") =", Fib(1));

    read ("Supply number ", x);
    writeLine("fib(", x, ") =", Fib(x));

// =====
$C+ // generate .cod file for checking manually
// Example of recursive function - Fibonacci EXAM05.FUN

    // function definition

    Fib(x) returns
        if (x == 0) 0;
        else if (x == 1) 1;
        else Fib(x - 1) + Fib(x - 2);

    // trial calls

    writeLine("fib(", 0, ") =", Fib(0));
    writeLine("fib(", 1, ") =", Fib(1));

    read ("Supply number ", x);
    writeLine("fib(", x, ") =", Fib(x));

```

```

// =====
$C+ // generate .cod file for checking manually
// Another example with errors EXAM06.FUN

    // function definitions

    AgeNow() returns 67;

    PlusOne(x) returns x + 1;

    // trial call

    writeLine("Pat will be", PlusOne(AgeNow), " next year");
    writeLine("Do you suppose he will live until he is",
        PlusOne(PlusOne(PlusOne(AgeNow))), "?");

// =====

$C+ // generate .cod file for checking manually
// Another example with errors EXAM07.FUN

    // function definitions

    Sqr(x) returns x * x;

    Sum(x, y) returns x + y;

    Sqr(y) returns y * y;

    // trial call

    read("Supply two numbers ", x, y);
    write("The sum of their squares is", Sum(Sqr(x), Sqr(y)));

// =====

$C+ // generate .cod file for checking manually
// Another example with errors EXAM08.FUN

    // function definitions

    Sqr(x) returns x * x;

    Sqr(x) returns x * x;

    Sum(x, y, z) returns x + y + z;

    Product(x, y, z) returns x * y * z;

    // trial calls

    read ("Supply three numbers ", x, y, z);
    writeLine("x =", x, ", y =", y, ", z =", z);
    writeLine("x squared =", Sqr(x),
        ", Sum = ", Sum(x, y, z),
        ", Product =", Product(x, y, z));

// =====
